Atomic partial charge

Coulomb's law:

$$|F| = k_{\rm e} \frac{|q_1||q_2|}{r^2} \tag{1}$$

Where

- Coulomb constant: $k_e = 9 \cdot 10^9 \frac{\text{N} \cdot \text{m}^2}{C^2}$
- q_1 and q_2 are the charges in Coulombs (C)
- \bullet r is the distance between the charges in meters (m)

Atomic partial charge

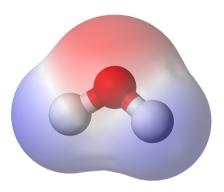

Figure: Representation of the electronic charge distribution of a water molecule. The oxygen atom has a partial negative charge, while the hydrogen atoms have partial positive charges[2].

Partial charge calculation

Experimentally (Spectroscopy):

• X-ray diffraction, Nuclear magnetic resonance, UV-Vis, etc

Computationally: Tradeoffs speed VS accuracy

• Quantum mechanics calculations: Evolution of a system through time

$$i\hbar \frac{\partial}{\partial t} |\psi(t)\rangle = \hat{H} |\psi(t)\rangle \qquad F = \frac{\partial}{\partial t} p$$

Quantum counterpart of Newton's second law of motion

• Force fields: Calculations based on a set of parameters

Message-passing neural network

$$\mathbf{e}'_{k} = \phi^{e} \left(\mathbf{e}_{k}, \mathbf{v}_{r_{k}}, \mathbf{v}_{s_{k}}, \mathbf{u} \right) \quad \overline{\mathbf{e}}'_{i} = \rho^{e \to v} \left(E'_{i} \right)$$

$$\mathbf{v}'_{i} = \phi^{v} \left(\overline{\mathbf{e}}'_{i}, \mathbf{v}_{i}, \mathbf{u} \right) \qquad \overline{\mathbf{e}}' = \rho^{e \to u} \left(E' \right)$$

$$\mathbf{u}' = \phi^{u} \left(\overline{\mathbf{e}}', \overline{\mathbf{v}}', \mathbf{u} \right) \qquad \overline{\mathbf{v}}' = \rho^{v \to u} \left(V' \right)$$

$$m = 0 \qquad m = 1 \qquad m = 2 \qquad m = 3$$

Figure: Message-passing neural network. Three update functions ϕ and three aggregation functions ρ are used to update the edge, node and global attributes[1].

References

Message-passing neural network

Node features: Element type

- Preprocess layer: 2 linear layers with batch normalization and ReLU activation functions to embed the element type into an internal continuous representation.
- Edge function layer: several linear layers with batch normalization and ReLU activation functions to compute edge features based on the node features of the adjacent nodes.
- GNN layer: applies a convolution operation to update the node features using the edge features as weights.
- GRU layer: applies a gated recurrent unit to update the node features.
- Predict layer: 2 linear layers with batch normalization and ReLU activation functions, followed by a linear layer with a single output.

Dataset generation

- The dataset is technically easy to generate:
 - SQL queries to extract the data from the database
 - Use a force field to compute the partial charges
- The hard part is to choose relevant molecules:
 - \bullet We chose drug-like molecules. Molecular weight around 300 g/mol, specific number of rotatable bonds, etc. (see Figure 4)

 ${\bf Conclusion}$

References

Conclusion

- We used a dataset of 130 000 molecules with partial charges
- We have trained a MPNN to predict the partial charges
- The model has a RMSE of 0.054
 - Elementary charge of a proton: 1.6×10^{-19} C
